

Part 2 Requirements

- 1 Design a relational schema based upon previous E/R diagram.
- 2 Write a *creation script* of SQL statements that will create your relational schema as a database under the class's **IBM DB2** system.
- 3 Populate the database with some provided data.
- 4 Test your database with an SQL query. (The query expressed in English is provided.) The SQL query and its resulting table will serve to determine whether your schema is logically sound.

*The enterprise for this project database is to keep track of *players* (accounts) in the online game (MMORPG) *Quest*. (Marketing has rebranded *Loot!* as *Quest*.)
